

# SO SoundChair Research

## Before sitting in the SoundChair

Plenty of activity but not balanced

There is no consistency in the pattern of frequencies

This pattern shows fairly chaotic mental activity, representing a lot of stress

## After sitting in the SoundChair

Total time in chair - 10 minutes

The mind is much calmer and not dominated by discordant activity

Calm mind

- Heart rate started very high - ended stabilized
- Temp started low - ended high - good circulation

White area peaks are mainly in Delta and Theta (slow wave frequencies)

This session was conducted by Dr. Robert Dallas on 12/22/04 and used the SO SoundChair. The session lasted 10 minutes and the first slide was before the session and the second is during the session. The graph shows a drastic change in biological and neurological states. The patient was a type "A" person. The music played started off as high energy rhythms and ended with a calmer type of music.

By coupling the body to a resonate membrane (the SO Sound Chair) and delivering tactile waves, the entire system is impacted in several ways: circulation is improved, vibrations permeate the entire body, the brain functions as a complete, interactive unit, internal organs are exercised allowing more complete toxin release, the auditory senses are stimulated which leads to more connections to these centers of the brain, decreased heart rate, higher skin temperature, lower skin conductance - less general muscle tension. The patient expressed having a clear sense of peace and well-being.
